

# Website Clarity and AI Readiness Review

---

Customer zero review of rabbitriversystems.com

|              |                                                                               |
|--------------|-------------------------------------------------------------------------------|
| PREPARED FOR | Rabbit River Systems                                                          |
| WEBSITE      | <a href="https://rabbitriversystems.com/">https://rabbitriversystems.com/</a> |
| REVIEW DATE  | September 15, 2026                                                            |
| PREPARED BY  | Kevin Butler                                                                  |

## Main conclusion

Rabbit River has built a credible place to think with Kevin. It has not yet given a qualified visitor a specific service to choose and buy. Publishing one bounded review, supported by this specimen, is the central business change. Repairing the site's crawler discovery files and URL signals is the central technical change.

## What the site needs next

Rabbit River Systems presents a distinctive, credible point of view in a calm visual system. A visitor can understand Kevin Butler's judgment, working style, and professional background, and can easily book a conversation. The central uncertainty is commercial: the site describes several areas of interest without establishing one paid deliverable that is available now.

The most useful first move is to turn the website diagnostic into a manually delivered service before the supporting software is finished. The homepage can then organize its strongest writing and evidence around that offer.

## What is already working

- The writing has a recognizable human voice and avoids generic consultant language.
- The visual system is restrained, consistent, and appropriate for a judgment-led service.
- Kevin's relevant technical, teaching, sales, Navy, HP, and Lenovo experience is easy to find.
- The working approach sets healthy expectations about scope, judgment, AI limitations, and handoff.
- Booking is visible throughout the site and includes direct Calendly and email fallbacks.
- The 18 reviewed pages each have one H1, a distinct title and description, and readable text in the page structure.

## The five changes that matter most

### 01 Publish one paid offer

Give the visitor a service they can understand, evaluate, and buy.

### 02 Repair robots and sitemap delivery

Serve valid crawler instructions and a real XML sitemap.

### 03 Use one URL form

Align internal links, redirects, canonical tags, social URLs, and the sitemap.

### 04 State the customer and service boundary

Make the intended owner, business type, and remote availability explicit.

### 05 Show the deliverable

Use this report as the first truthful specimen of the service.

# Six views of the public website

These judgments are directional. They identify where direct evidence is strong, incomplete, or absent. They are not combined into a numerical score because one consequential failure can matter more than many minor passes.

| Lens                     | Judgment        | Meaning                                                                                 |
|--------------------------|-----------------|-----------------------------------------------------------------------------------------|
| Business identity        | Needs attention | The business and founder are clear; the market and service boundary are not.            |
| Offer clarity            | Unclear         | No specific paid deliverable is presented as available now.                             |
| Customer friction        | Needs attention | Booking is easy; deciding what to hire Kevin for is less clear.                         |
| Search and retrieval     | Needs attention | Good textual structure is offset by broken discovery files and conflicting URL signals. |
| Evidence and trust       | Needs attention | Professional history is strong; proof of the current service is absent.                 |
| Agentic action readiness | Needs attention | An agent can find Kevin and book, but cannot explain a purchasable offer or its terms.  |

## Sitewide observations

|          |                                                     |
|----------|-----------------------------------------------------|
| 18       | representative public pages reviewed                |
| 18 of 18 | pages with one H1, title, and description           |
| 18 of 18 | pages containing internal .html links that redirect |
| 0 of 18  | pages with JSON-LD structured data                  |
| 0 of 18  | pages with an Open Graph image                      |
| 1 of 18  | pages with an Open Graph URL                        |

## Evidence and recommended changes

Each finding separates the observed evidence from its likely consequence. The recommendation states a result that an owner or web professional can verify after making the change.

### FINDING 01 FIX NOW

## Finding 1 Publish one offer that is ready to buy

**STATUS** Observed **LENS** Offer clarity **EFFORT** Moderate **CONFIDENCE** High

### Observed evidence

The homepage presents website, sales, and AI lanes. The Website Diagnostic page says the product is in development and that its final checklist, price, and delivery time are not set. The Sales page says the associated tool is not for sale. The AI materials are free. The recurring commercial action is to book a preliminary conversation.

**LOCATION** Homepage, Solutions, Website Diagnostic, Sales, and AI Transformation

### Why it matters

**CUSTOMER** A visitor can appreciate the thinking and still be unable to choose, compare, or purchase a defined service.

**SEARCH OR AGENT** The public site supports a description of Rabbit River's interests, but not a confident answer to what a customer can hire the company to deliver now.

### Recommended change

Publish the Website Clarity and AI Readiness Review with its intended customer, deliverable, page limit, turnaround, price, exclusions, and buying process.

**RESPONSIBLE** Kevin Butler

**VERIFY** A first-time visitor can answer who the review is for, what arrives, when it arrives, what it costs, and how to begin without speaking to Kevin first.

## Finding 2 State the customer and service boundary

STATUS Observed LENS Business identity EFFORT Low CONFIDENCE High

### Observed evidence

The site refers broadly to businesses and small businesses. Sales examples strongly evoke contractors and owner-operated service companies. The footer says Pacific Northwest, but no reviewed page states whether the work is regional or delivered remotely.

**LOCATION** Homepage, Solutions, About Kevin, footer, and sales examples

### Why it matters

**CUSTOMER** A suitable owner may not know whether Rabbit River is intended for a business like theirs or whether the company serves their location.

**SEARCH OR AGENT** A system has to infer the intended market and cannot reliably answer audience- or location-specific questions from direct evidence.

### Recommended change

State that the initial review is for owner-operated US service businesses and is delivered remotely. Repeat the boundary on the offer and booking pages.

**RESPONSIBLE** Kevin Butler

**VERIFY** The intended customer and service geography can be quoted directly from visible page text.

## Finding 3 Show proof of the current deliverable

STATUS Observed LENS Evidence and trust EFFORT Moderate CONFIDENCE High

### Observed evidence

The site presents Navy electronics, technical teaching, field repair, systems engineering, more than 25 years in technology sales, HP, Lenovo, a founder photograph, and LinkedIn. It does not show a completed diagnostic, report excerpt, current case example, or customer quotation.

**LOCATION** Homepage and About Kevin

### Why it matters

**CUSTOMER** The visitor can believe Kevin is experienced while remaining uncertain about what the new review produces.

**SEARCH OR AGENT** Public evidence supports the biography more strongly than the present-day service.

### Recommended change

Publish a representative excerpt from this Rabbit River review. Label the self-review honestly. Add the first permissioned customer example when one exists.

**RESPONSIBLE** Kevin Butler

**VERIFY** The offer page shows a truthful example of evidence, prioritization, explanation, and handoff.

## Finding 4 Repair the crawler discovery files

STATUS Observed LENS Search and retrieval EFFORT Low CONFIDENCE High

### Observed evidence

On September 15, 2026, robots.txt returned valid Cloudflare-managed directives followed by the complete homepage HTML. The sitemap.xml URL returned the homepage HTML with a 200 response and text/html content type rather than an XML sitemap. No Sitemap directive appeared in the robots rules that preceded the HTML.

**LOCATION** <https://rabbitriversystems.com/robots.txt> and [/sitemap.xml](https://rabbitriversystems.com/sitemap.xml)

### Why it matters

**CUSTOMER** There is little direct visual impact, but the defect undermines the site's claim that it can diagnose crawler-facing information.

**SEARCH OR AGENT** A crawler receives a malformed robots response and no usable sitemap at the conventional sitemap URL. Discovery can still occur through links, but the intended machine guidance is unreliable.

### Recommended change

Serve a plain-text robots file without appended HTML. Serve a valid XML sitemap with the correct content type and final canonical URLs. Reference the sitemap from robots.txt.

**RESPONSIBLE** Web developer or hosting administrator

**VERIFY** Both URLs return the intended content and content type; robots validation passes; the XML sitemap parses and lists only final 200-status canonical URLs.

## Finding 5 Use one URL form throughout the site

STATUS Observed LENS Search and retrieval EFFORT Low CONFIDENCE High

### Observed evidence

Every reviewed page contains internal links ending in .html. Those URLs redirect with status 308 to extensionless paths. Canonical tags on internal pages generally point to the .html form instead of the final extensionless URL. For example, /solutions.html redirects to /solutions, while the rendered /solutions page declares /solutions.html as canonical.

**LOCATION** All 18 reviewed pages

### Why it matters

**CUSTOMER** The redirect is usually invisible, but copied and shared URLs are inconsistent and every internal click adds an avoidable request.

**SEARCH OR AGENT** Internal links, redirects, canonical markup, and the final page URL provide competing identity signals.

### Recommended change

Adopt extensionless URLs as canonical. Update internal links, canonical tags, Open Graph URLs, and the new sitemap to use the final paths. Keep one-way redirects from legacy .html URLs.

**RESPONSIBLE** Web developer

**VERIFY** Primary internal links land without redirects, each canonical exactly matches the final URL, and legacy .html requests redirect once to that URL.

## Finding 6 Add accurate entity and sharing metadata

STATUS Observed LENS Search and retrieval EFFORT Low CONFIDENCE High

### Observed evidence

All 18 pages have a title, description, and one H1. None includes JSON-LD or an Open Graph image. Only one reviewed page includes an Open Graph URL. The two observed photographs have useful alternative text.

**LOCATION** All 18 reviewed pages

### Why it matters

**CUSTOMER** Shared links may appear without a recognizable image or stable page identity.

**SEARCH OR AGENT** Visible text is available, but systems receive less explicit context about the organization, founder, authorship, service, and relationship among pages.

### Recommended change

Add page-specific Open Graph metadata and accurate Organization or ProfessionalService, Person, Service, and Article data where the visible page supports it. Do not add invisible or aspirational claims.

**RESPONSIBLE** Web developer

**VERIFY** Social preview tools show the intended title, description, image, and final URL. Structured-data validation reports no errors, and every claim is visible on the page.

## Finding 7 Establish and monitor index visibility

**STATUS** Observed snapshot with inference **LENS** Search and retrieval **EFFORT** Moderate **CONFIDENCE** Medium

### Observed evidence

A web search for the exact business name with Kevin Butler, the exact business name with website diagnostic, and a site-restricted query returned no Rabbit River result in the search interface used for this review. This snapshot does not establish that every search provider has failed to index the site.

**LOCATION** Web search snapshot on September 15, 2026

### Why it matters

**CUSTOMER** People who hear the business name elsewhere may have difficulty confirming the company through search.

**SEARCH OR AGENT** Search-grounded systems may lack retrievable brand evidence until the site is indexed and supported by consistent external references.

### Recommended change

Repair discovery files, verify ownership in Google Search Console and Bing Webmaster Tools, submit the sitemap, inspect representative URLs, and monitor branded impressions. Maintain accurate external profiles that support the same business identity.

**RESPONSIBLE** Business owner and web developer

**VERIFY** Search-console tools report successful discovery and indexing for primary pages, and dated branded queries begin returning the final canonical pages.

## Finding 8 Give small supporting text more contrast margin

STATUS Observed LENS Customer friction EFFORT Low CONFIDENCE High

### Observed evidence

The slate text color #66706B against the paper background #F3F0E8 calculates to approximately 4.50 to 1 and is used at sizes as small as 11 to 13 CSS pixels. The combination sits at the WCAG minimum for ordinary text with almost no margin.

**LOCATION** Captions, row metadata, and footer details

### Why it matters

**CUSTOMER** Secondary information may be harder to read on lower-quality displays or for people with reduced contrast sensitivity.

**SEARCH OR AGENT** No material retrieval consequence was observed because the text remains available in the document structure.

### Recommended change

Darken the slate color enough to create a comfortable margin above the minimum while preserving the visual hierarchy.

**RESPONSIBLE** Web developer or designer

**VERIFY** Normal-size text passes automated contrast testing with margin and remains visually subordinate to primary copy.

## What the public site lets an assistant establish

These probes test whether the site supplies enough evidence to complete realistic customer tasks. They evaluate the website's information, not the permanent behavior of any one model or search product.

### Probe 1 Explain what Rabbit River Systems sells

**RESULT** Partial

**EVIDENCE** The site describes practical tools, diagnostics, sales follow-through, AI hygiene, and marketing thinking.

**AMBIGUITY** It does not establish one paid deliverable that is available now or state its commercial terms.

**NEXT CHANGE** Publish the version 0.1 review as a defined offer.

### Probe 2 Determine whether Rabbit River serves a particular owner or location

**RESULT** Unresolved

**EVIDENCE** The site refers to small businesses and says Kevin is based in the Pacific Northwest.

**AMBIGUITY** The customer profile, service geography, and remote-delivery policy are not stated.

**NEXT CHANGE** Name the initial customer and US remote-delivery boundary directly.

### Probe 3 Find help for a website that leaves customers confused

**RESULT** Partial

**EVIDENCE** The homepage and Website Diagnostic page identify a diagnostic and describe an evidence-based handoff.

**AMBIGUITY** The diagnostic is labeled in development; price, final scope, delivery time, and immediate availability are unset.

**NEXT CHANGE** Replace the development notice with the bounded offer after this specimen passes review.

## Probe 4 Establish why Kevin is credible to perform the review

**RESULT** Partial

**EVIDENCE** The site supplies relevant technical, teaching, systems-engineering, and sales experience, including HP and Lenovo, plus a LinkedIn path.

**AMBIGUITY** No current diagnostic or customer outcome is shown.

**NEXT CHANGE** Publish a representative excerpt from this report and later add permissioned customer evidence.

## Probe 5 Book the first conversation

**RESULT** Clear

**EVIDENCE** Book 20 minutes appears consistently. The booking page explains the call, embeds a 20-minute Calendly event, and provides direct Calendly and email fallbacks.

**AMBIGUITY** No material ambiguity was observed in beginning the booking path.

**NEXT CHANGE** Preserve this pattern when the paid offer is added.

## Probe 6 Determine the limits of the engagement

**RESULT** Clear

**EVIDENCE** The approach and diagnostic pages distinguish the handoff from implementation, hosting, maintenance, open-ended work, and search guarantees.

**AMBIGUITY** The exact commercial boundary remains unset because the offer is not yet published.

**NEXT CHANGE** Carry the existing limits into the offer page and purchase terms.

## What to change and who should own it

The order below reflects consequence and dependency. The offer and crawler repairs should precede a broader homepage rewrite because they establish what the site must sell and which URLs machines should treat as authoritative.

| Priority              | Change                                                 | Responsible                         | Effort   |
|-----------------------|--------------------------------------------------------|-------------------------------------|----------|
| <b>Fix now</b>        | Define and publish version 0.1 of the paid review      | Kevin Butler                        | Moderate |
| <b>Fix now</b>        | Serve a clean robots file and valid XML sitemap        | Web developer or host administrator | Low      |
| <b>Fix now</b>        | Align links, canonicals, social URLs, and sitemap URLs | Web developer                       | Low      |
| <b>Fix now</b>        | State the initial customer and remote service boundary | Kevin Butler                        | Low      |
| <b>Fix next</b>       | Publish an excerpt from this specimen                  | Kevin Butler                        | Moderate |
| <b>Fix next</b>       | Add accurate entity and social-sharing metadata        | Web developer                       | Low      |
| <b>Fix next</b>       | Verify index coverage and monitor branded discovery    | Kevin and web developer             | Moderate |
| <b>Fix next</b>       | Reorganize the homepage around the available offer     | Kevin and web developer             | Moderate |
| <b>Consider later</b> | Increase contrast margin for small secondary text      | Web developer or designer           | Low      |
| <b>Consider later</b> | Reserve the northeast arrow for external links         | Web developer                       | Low      |

### Recommended first move

Finish and price the Website Clarity and AI Readiness Review, then replace the development notice with the real offer. In parallel, repair the sitemap, robots response, and URL signals before using this report as a public specimen.

## How this review was performed

The review covered 18 representative public pages on September 15, 2026. Evidence came from rendered desktop pages, accessible names and document structure, metadata, internal links, redirect responses, crawler discovery files, the public Calendly destination, and dated web-search queries.

The stylesheet contains responsive changes at 1,000, 880, and 520 CSS pixels. The browser used for this review did not honor its temporary viewport override, so this specimen does not claim a complete rendered narrow-screen inspection. Physical-device or reliable emulation evidence remains a required addition before the method is offered to customers.

The review used public information only. It did not inspect analytics, Search Console, source code, internal business records, customer behavior, or authenticated systems. Search results and AI-generated answers vary by system, date, location, and context. The observations do not guarantee ranking, indexing, citation, recommendation, leads, or revenue.

## Interpretation rules

- Observed means the condition was directly visible or technically verifiable.
- Inference means the likely consequence follows from evidence but was not measured in customer data.
- Unverified questions require owner input, internal access, or specialist testing and are not presented as findings.
- A simulated or live agent response can illustrate ambiguity but cannot prove customer behavior or future visibility.
